

SCOPE OF WORK

Inventory Management System

Client Name	Acme Corporation	Document Date	October 12, 2024
Project Name	Inventory Management System	Document Status	Final for Sign-off
Technical Partner	TechNova Solutions LLC	Channel Partner	Global Implementations Inc.

1. EXECUTIVE SUMMARY

The objective of this engagement is to design and implement an end-to-end Inventory Management System for **Acme Corporation**. This system will eliminate manual stock counting, streamline cross-warehouse reconciliation, and automate critical low-stock notifications.

By automating the ingestion of daily supplier and dispatch files into a centralized database (managing ~5,000 SKUs daily), the platform will save resource hours, proactively manage Restock Timelines, and provide unified visibility to the Procurement Team via a localized web dashboard.

2. SYSTEM ARCHITECTURE & ROLES

The solution will be developed as a secure cloud-based web application. Users will interact with a single web UI without the need to switch between disparate legacy tools to manage their workflows.

Role-Based Access Control (RBAC)

- Admin:** Full system access, vendor configuration rights, and user management.
- Manager (Procurement):** Full access to inventory reporting, approval workflows, and dashboard oversight.
- Clerk (Warehouse):** Restricted operational access for receiving logs and stock level viewing.

3. PHASED DELIVERABLES & SCOPE

Phase	Inputs / Actions	Target Output / Logic
Phase 1: Receiving to Main DB	• Upload <i>Daily Receipt Logs</i> • Formats: CSV / Excel • Trigger: Automated daily between 5 PM - 6 PM (with Manual Override)	• System extracts data from the input logs. • Adds new SKUs or updates existing inventory counts in the target database: Master Stock Ledger.
Phase 2: Dispatch to Fulfillment	• Upload <i>Fulfillment Sheet</i> • Formats: CSV / Excel	• System calculates outgoing stock and updates the Dispatch Records Module. • Targets two specific sub-reports: <i>Daily Shipped</i> and <i>Pending Orders</i>.
Phase 3: Vendor to Reorder Sheet	• Upload <i>Vendor Supply Data</i> • Formats: CSV / Excel	• System maps supplier lead times. • Populates or updates corresponding rows in the Automated Reorder Pipeline.

4. CORE FUNCTIONAL REQUIREMENTS

- **Centralized Data Processing:** A centralized portal to upload CSV/Excel files and direct data logic to the appropriate database tables without requiring users to manually cross-reference spreadsheets.
- **Smart Stock Filtering:** The system will identify items marked as "Discontinued." To save processing time, the system will only track, scan, and update "Active" SKUs.
- **Global Status Synchronization:** All modules contain Reorder and Lead Time columns. Upon execution, if the system detects an updated Lead Time, it will automatically sync this metric across all dashboards to ensure data uniformity.
- **Automated Notification Triggers:**
 - Auto-alert dispatched to procurement when a SKU drops below the defined minimum threshold.
 - Automated weekly digest emails configured by the Manager or Admin.

5. OUT OF SCOPE

- Direct integration or API connections into third-party HR/Payroll systems. All employee access is managed manually via the Admin panel.
- Hardware procurement, including barcode scanners, RFID readers, or physical server racks.
- Migration of historical data older than 3 years from the legacy desktop software.

6. PROJECT SIGN-OFF & AUTHORIZATIONS

By signing below, the stakeholders acknowledge that they have reviewed, understood, and agreed to the specifications, constraints, and deliverables detailed within this Inventory Management System Scope of Work.

CLIENT APPROVER (MANAGER)

SIGNATUREDATE

Name:

Title: Manager, Procurement Team

Company: Acme Corporation

CLIENT APPROVER (ADMIN)
